

13 SIMULTANEOUS TRANSMISSION

Simultaneous transmission SAR test exclusion is determined for each operating configuration and exposure condition according to the reported standalone SAR of each applicable simultaneous transmitting antenna. When the sum of SAR 1g of all simultaneously transmitting antennas in an operating mode and exposure condition combination is within the SAR limit (SAR 1g 1.6 W/kg), the simultaneous transmission SAR is not required. When the sum of SAR 1g is greater than the SAR limit (SAR 1g 1.6 W/kg), SAR test exclusion is determined by the SAR to Peak Location Ratio (SPLSR).

According KDB 447498 D01v06, simultaneous transmission:

- a) SPLSR = $(\text{SAR1} + \text{SAR2})^{1.5} / R_i$ (min. separation distance, mm), and the peak separation distance is determined from the square root of $[(x_1-x_2)^2 + (y_1-y_2)^2 + (z_1-z_2)^2]$, where (x_1, y_1, z_1) and (x_2, y_2, z_2) are the coordinates of the extrapolated peak SAR locations in the zoom scan.
SAR1 is the highest reported or estimated SAR for the first of a pair of simultaneous transmitting antennas, in a specific test operating mode and exposure condition.
SAR2 is the highest reported or estimated SAR for the second of a pair of simultaneous transmitting antennas, in a specific test operating mode and exposure condition as the first.
- b) If $\text{SPLSR} \leq 0.04$, simultaneously transmission SAR measurement is not necessary.
- c) Simultaneously transmission SAR measurement, and the reported multi-band SAR $< 1.6\text{W/kg}$.

13.4 Estimated SAR Calculation

According to KDB 447498 D01, when standalone SAR test exclusion applies to an antenna that transmits simultaneously with other antennas, the standalone SAR was estimated according to following formula to result in substantially conservative SAR values of <= 0.4 W/kg to determine simultaneous transmission SAR test exclusion.

$$\text{Estimated SAR} = \frac{\text{Max.Tune Up Power(mw)}}{\text{Min Test Separation Distance}} * \frac{\sqrt{f_{GHz}}}{x} \quad (\text{where } x = 7.5 \text{ for 1-g SAR})$$

If the minimum test separation distance is < 5 mm, a distance of 5 mm is used for estimated SAR calculation. When the test separation distance is > 50 mm, the 0.4 W/kg is used for SAR-1g.

The figure shows a 3D simulation of SAR distributions for two antennas. The top part displays a heatmap of SAR values for the WLAN 5GHz(Aux) antenna, with a color scale from blue to red. The bottom part shows the WCDMA Band 2 antenna. A coordinate system (x, y, z) is indicated at the bottom left. A small 3D model of the device is also visible.

The diagram illustrates a 3D SAR simulation setup. It shows a circular object with two rectangular antennas placed on its surface. The left antenna is labeled "WLAN 2.4GHz(Aux)" and the right one "LTE Band 26". A coordinate system with axes x, y, and z is located at the bottom left. A red dot on a vertical axis indicates the measurement point. A red arrow points from the measurement point towards the antennas.

The diagram illustrates a 3D SAR simulation setup. A central rectangular area represents the device's internal components, with two red rectangular regions labeled "WLAN 5GHz(Aux)" and "LTE Band 30". This central area is set against a large, semi-transparent circular background representing the device's back cover. A small circular hole is visible on the left side of the cover. At the bottom left, a 3D coordinate system is shown with axes labeled x, y, and z. A vertical red arrow points downwards from the center, and a horizontal green arrow points to the right. The entire setup is contained within a light blue rectangular frame.
